## Comp 336/436 - Markup Languages

Fall Semester 2018 - Week 7

Dr Nick Hayward

## XML - transforming & rendering - XSLT template

- <template> is the main element of a XSLT document
  - may contain many additional directives (elements)
- a template may be iteratively applied to elements in the XML document
  - using different tags, e.g. <xsl:for-each ...>
  - e.g.

```
<xsl:template match="chapter">
<xsl:for-each select="paragraph">
<xsl:value-of select=".">
</xsl:for-each>
</xsl:template>
```

- this example applies a template
  - selects content of each paragraph inside a chapter

# XML - transforming & rendering - XSLT template usage

- one or more sets of rules called templates
- a template contains rules for a specified matched node
- <xsl:template> element is used to build templates
- match attribute associates a template with an XML element

```
<xsl:template match="/">
```

```
<?xml-stylesheet type="text/xsl" href="christie-full.xsl"?>
```

#### XSLT - part I

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
    Author
   .
    .
   </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

#### XSLT - <xsl:value-of>

- <xsl:value-of>
  - used to extract the value of an XML element
  - and add to transformation output
  - e.g.

```
<xsl:value-of select="catalogue/book/title"/>
<xsl:value-of select="catalogue/book/author"/>
```

- select attribute's value contains an XPath expression
- XPath expression navigates to the given position in the XML
- value of an attribute can be found using an expression such as

```
<xsl:value-of select="catalogue/book/title/@id"/>
```

or

<xsl:value-of select="catalogue/book/title/attribute::id"/>

#### XSLT - part 2

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
   <xsl:value-of select="catalogue/book/title"/>
     <xsl:value-of select="catalogue/book/author"/>
   </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

### Exercise - part 2

- create an initial XSL document
  - output heading for rendered
  - get value of the first two elements per item
  - e.g. title & author from book
- test XSL with XML file
  - open XML with XSL in browser and check rendering...

#### XSLT - <xsl:for-each>

• used to select every element from a specified set

```
<xsl:for-each select="catalogue/book">
<xsl:value-of select="title"/>
<xsl:value-of select="author"/>
</xsl:for-each>
```

#### XSLT - part 3

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
   <xsl:for-each select="catalogue/book">
     <xsl:value-of select="title"/>
     <xsl:value-of select="author"/>
   </xsl:for-each>
 </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

#### Exercise - part 3

- add an extra book, album, &c. to your XML
- modify XSL
  - add <xsl:for-each> for a given parent element
  - e.g. <xsl:for-each select="catalogue/book">
  - use <xsl:value-of> to get values for the first two elements per item
- test XSL with XML file

#### XSLT - <xsl:for-each> filtering

<xsl:for-each select="catalogue/book[author='Agatha Christie']">

- filter XML output using additional operators, e.g.
  - = (equal)
  - != (not equal)
  - < (less than)
  - > (greater than)

<xsl:for-each select="catalogue/book[author='Agatha Christie' and year='1941']">

#### XSLT - part 4

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
   <xsl:for-each select="catalogue/book[year='1937']">
     <xsl:value-of select="title"/>
     <xsl:value-of select="author"/>
   </xsl:for-each>
 </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

### Exercise - part 4

- add filtering to <xsl:for-each>
- modify the output to render this filtered result
  - e.g. an extra column for year
- test XSL with XML file

#### XSLT - part 5

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
     Year
   <xsl:for-each select="catalogue/book[year!='1937' and year&lt;1942]">
     <xsl:value-of select="title"/>
     <xsl:value-of select="author"/>
     <xsl:value-of select="year"/>
   </xsl:for-each>
 </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

#### **XSLT -** <*xsl:sort>*

sort returned data from XML

```
<xsl:sort select="title"/>
```

we can then add the sort filter to the for-each option

```
<xsl:for-each select="catalogue/book">
<xsl:sort select="title"/>
```

default sort order is ascending

#### XSLT - part 6

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
   <xsl:for-each select="catalogue/book">
   <xsl:sort select="title"/>
   <xsl:value-of select="title"/>
     <xsl:value-of select="author"/>
   </xsl:for-each>
 </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

### Exercise - part 5

- add a sort option to <xsl:for-each>
- modify the output to render this sorted result
  - add a note to rendered output for chosen sort order...
- test XSL with XML file

#### XSLT - <xsl:if>

- conditional test within the template
  - for certain conditions and requirements in the XML

```
<xsl:if test="year &gt; 1929">
    ...
</xsl:if>
```

- value of test attribute contains expression to be tested
  - year elements with values greater than 1929
  - i.e. year > 1929

#### XSLT - part 7

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
     Year
   <xsl:for-each select="catalogue/book">
   <xsl:sort select="title"/>
   <xsl:if test="year &gt; 1937">
   <xsl:value-of select="title"/>
     <xsl:value-of select="author"/>
     <xsl:value-of select="year"/>
   </xsl:if>
   </xsl:for-each>
 </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

#### Exercise - part 6

- add a conditional option to <xsl:for-each>
- modify the output to render this conditional result
  - add a note to rendered output for chosen conditional...
- test XSL with XML file

#### XSLT - <xsl:choose>

- use <xsl:choose> with <xsl:when> or <xsl:otherwise>
  - test multiple conditions in XML

#### XSLT - <xsl:choose>

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
 <html>
 <body>
 <h2>Collection</h2>
 Title
     Author
   <xsl:for-each select="catalogue/book">
     <xsl:value-of select="title"/>
     <xsl:choose>
     <xsl:when test="year &gt; 1941">
        After: <xsl:value-of select="author"/>
     </xsl:when>
     <xsl:otherwise>
        Before: <xsl:value-of select="author"/>
     </xsl:otherwise>
     </xsl:choose>
   </xsl:for-each>
 </body>
 </html>
</xsl:template>
</xsl:stylesheet>
```

#### Exercise - part 7

- modify existing conditional option
  - use <xsl:choose> with <xsl:when> and <xsl:otherwise>
- modify the output to render this conditional result
  - add a note to rendered output for chosen conditional...
- test XSL with XML file

#### XSLT - <xsl:apply-templates>

- add a template to a current element or its child nodes
- use a select attribute
  - only process child element specified in the value
- use a select attribute
  - specify order of child node processing

#### XSLT - template and match

- then use standard <xsl:template>
  - add match attribute to specify required element
  - add further XSL options to modify elements &c.

#### e.g.

#### **XSLT -** < xsl:apply-templates>

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xsl:stylesheet version="1.0"</pre>
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
  <html>
  <body>
  <h2>Collection</h2>
  <xsl:apply-templates/>
  </body>
  </html>
</xsl:template>
<xsl:template match="book">
  <xsl:apply-templates select="title"/>
  <xsl:apply-templates select="author"/>
  </xsl:template>
<xsl:template match="title">
  Title: <span class="title"><xsl:value-of select="."/></span>
  <br />
</xsl:template>
<xsl:template match="author">
  Author: <span class="author"><xsl:value-of select="."/></span>
  <br />
</xsl:template>
</xsl:stylesheet>
```

### Exercise - part 8

- modify existing XSL
- abstract XSL to use <xsl:template> and <xsl:apply-templates>
- test XSL with XML file
